Fransgård

Main Advantages of Fransgard winches

- Overall height is a key design element of the Fransgard winches. This gets the butt ends of the logs off the ground sooner, with less tractor horse power requirement & fuel consumption, as well as minimizing dirt on the logs.
- The higher top pulley optimizes the distance to the cable drum which enhances optimal spooling of the cable on the cable drum.
- Overall weight confirms the heavy duty design of Fransgard winches, and provides better traction for the tractor.
- Top pulley has double bearings ensuring less friction on the cable and thus longer cable life.
- Easy clutch adjustment with the two bolts; without having to touch the main shaft nut avoids misaligning and “unloading” the bearings on the main shaft.
- Easy replacement of the drive chain can be done on the work site. On Fransgard Winches, the bottom & top covers may be removed to facilitate feeding the drive chain on to the main gear.
- Forged hook on the end of the cable enables adding a choker chain to the end. The special throat of the hook supports 3 links of the choker chain preventing less breakage of the chain minimizing the shearing effect on the chain when a load is applied to the chain
- Warranty: 1 year on winch on manufacturing defects & 5 years on clutch
